ICHTIOFAUNA DORZECZA RZEKI ROPY

ICHTHYOFAUNA OF THE RIVER ROPA CATCHMENT AREA

ABSTRACT

The investigations of the River Ropa catchment area were conducted in 1972 and 1988-1993. The water environment of chatching sites was characterized and occurring fish species. On the basis of fish assemblages (groups) occurring and physiography of the catching area this was divided in 4 fish zones A, B,C, D. The present frequency and biomass of fish was compared with that encountered in 1972.
